

# Bash in\_1\_page

cd <filepath>

cd ..

cd -

ls

+

-

touch <file>

mkdir (📁)

rm <file>

-r (📁)

cp <file> <new file>

-r (📁)

## Navigation and file manipulation

## Globbing - str matching

ls \*.txt

📄

📄

📄

list all files with .txt in their name

'\*' means any string

ls new\*.txt

📄

📄

list any files that start with 'new' and end with '.txt'

new\_file.txt

old\_file.txt

Also works with:

cp, mv, cat, grep, find

## Useful Bash shortcuts

press

+

ls new

=

ls new\_file.txt

📄

hold

+

ls new

=

ls new\_file\*

📄📄📄

Tab ⇌

Ctrl

C

=

## Most important commands for navigation and file manipulation:

<code>cd /fred/oz002</code> <code>cd ../</code> <code>cd -</code>	Move to the directory <code>/fred/oz002</code> Move up one directory Go back to previous directory
<code>ls (-lrt) /fred/oz002</code>	List files in the directory <code>/fred/oz002</code> (including metadata)
<code>cp file file2</code> <code>cp file /fred/oz002/.</code> <code>cp -r folder folder2</code>	Make a copy of <code>file</code> and call it <code>file2</code> Make copy of <code>file</code> and put it in <code>/fred/oz002</code> Make copy of folder and all contents (-r recursive)
<code>rm (-r) stuff</code>	Remove file (-r to remove folder and all contents)
<code>mv file /fred/oz002/.</code> <code>mv file file2</code>	Move file to <code>/fred/oz002</code> Rename <code>file</code> to <code>file2</code>
<code>touch file</code>	Create empty file
<code>mkdir dir</code>	Create empty directory/folder
<code>cat file</code> <code>cat file   less</code>	Display all contents of file Display contents of file gradually
<code>grep (-n) "str" file</code>	Find all occurrences of <code>str</code> in <code>file</code> (-n include line numbers)
<code>find -name "myfile.txt"</code>	Find file named <code>myfile.txt</code> and print out its filepath
<code>ln -s /fred/oz002 sym_dir</code>	Make directory <code>sym_dir</code> that points to <code>/fred/oz002</code>

## Other Useful commands:

<code>pwd</code>	Print fullpath of current directory
<code>echo "hello"</code> <code>echo \$var</code>	Print <code>"hello"</code> to terminal Print <code>var</code> variable to terminal
<code>clear</code>	clear text in terminal
<code>history</code>	list previous commands that were run in terminal
<code>display image.png</code>	Display <code>image.png</code> in GUI window (requires X11 forwarding)
<code>chmod &lt;perms&gt; file</code>	Change permission <code>&lt;perms&gt;</code> of <code>file</code>
<code>man &lt;command&gt;</code>	Open manual (help) of bash command
<code>exit</code>	Exit shell (ipython, ssh, sinteractive session)

# SLURM in\_1\_page

## JOB

```
#!/bin/bash
#
#SBATCH --job-name=test
#SBATCH --output=test_%j.txt
#
#SBATCH --time=20:00
#SBATCH --mem=8GB
```

```
bash script.sh
bash script2.sh
```

## TASKS

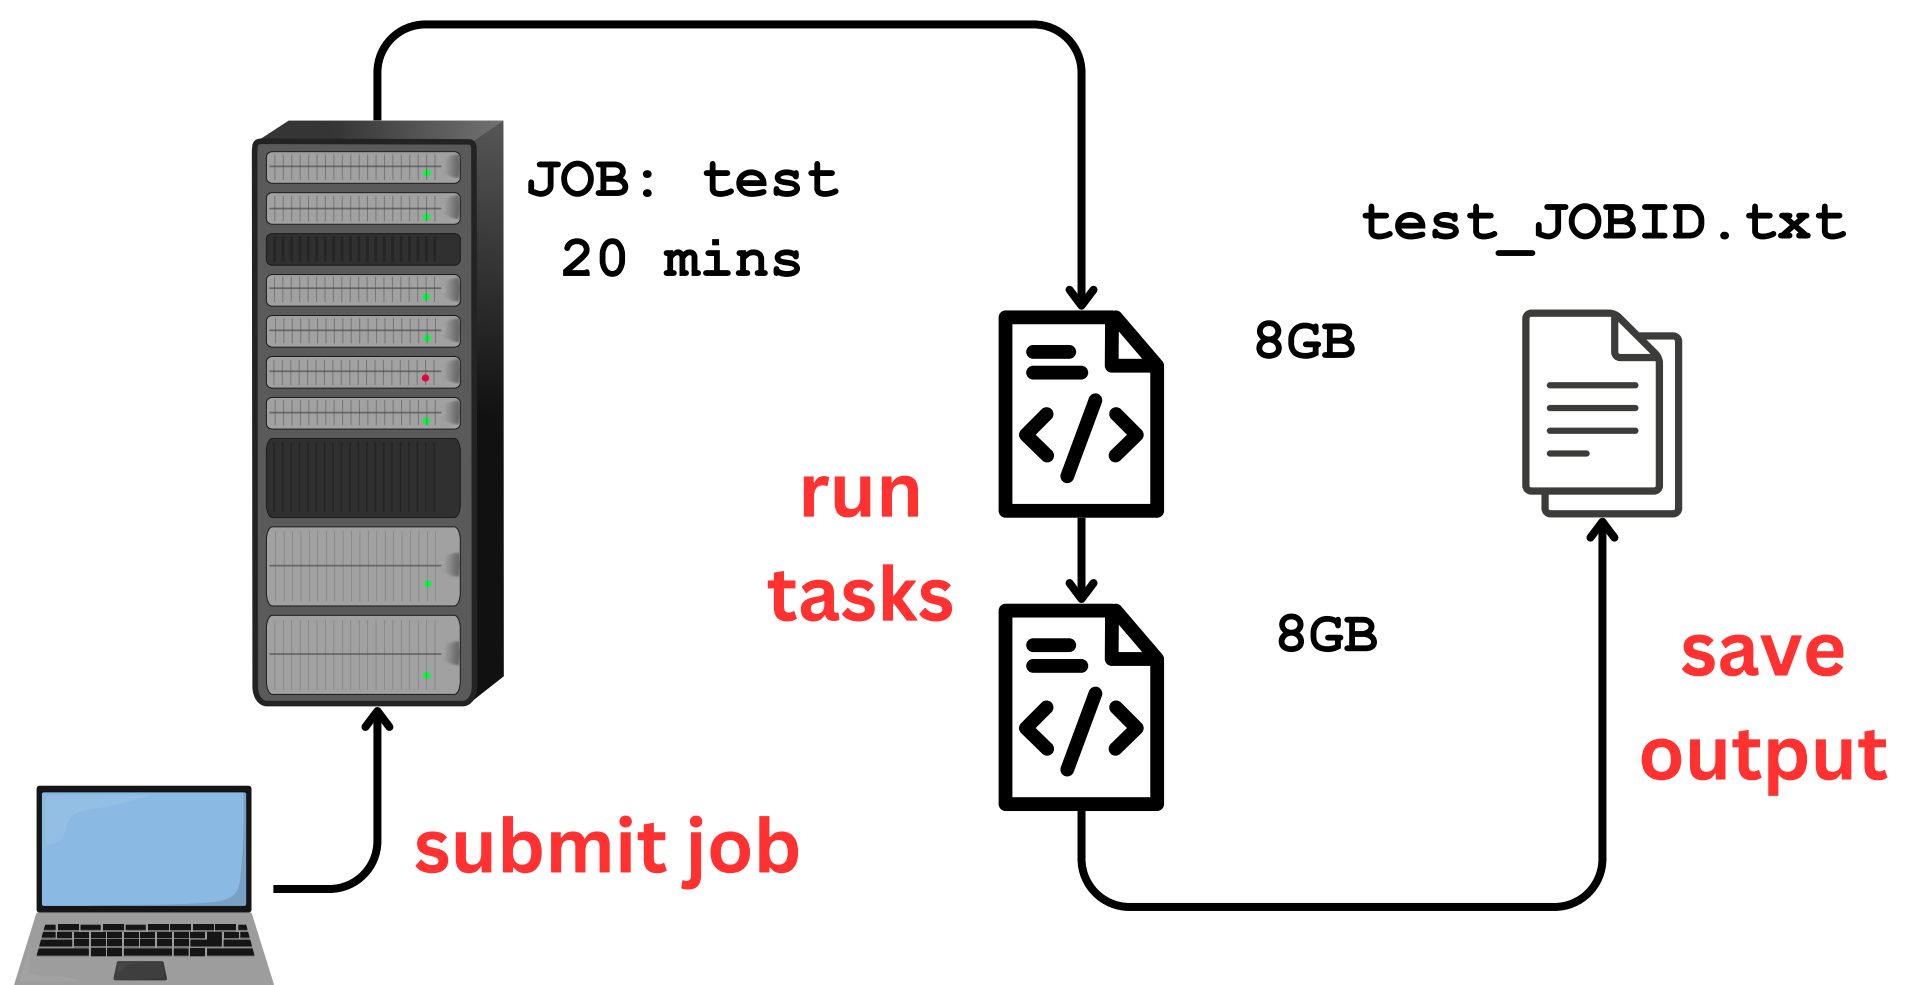

```
> sbatch slurm_script
```

```
#!/bin/bash
#
#SBATCH --job-name=test
#SBATCH --output=test_%j.txt
#
#SBATCH --time=20:00
#SBATCH --mem-per-cpu=8GB
#SBATCH --ntasks=2
```

```
srun --opt script.sh
```

```
> sbatch slurm_script
```

## allocate resources

## Run in parallel

specify resources for srun task

## Commands

```
[user]$ sbatch slurm_script
submitted batch job 500
```

Start slurm job with job id -j

```
[user]$ squeue -j 500
```

Check status of job

(-u <user> will list all the users jobs)

```
[user]$ scancel -j 500
```

Cancel job

(-u <user> will cancel all the users jobs)

# SLURM --Options

Option	Description
<code>--job_name=""</code>	Name of Job
<code>--output=""</code>	All text outputs during runtime are saved to this file
<code>--time=dd:hh:mm:ss</code>	Requested time to run job
<code>--mem=8GB</code>	Requested memory, units can be K, M, G and T
<code>--ntasks=4</code>	Run 4 parallel instances of each a task or script
<code>--gpus=2</code>	Requested number of gpus
<code>--mem-per-cpu=4GB</code>	Requested memory for each cpu
<code>--cpus-per-task=4</code>	Requested number of cpus per task
<code>--mem-per-gpu=4GB</code>	Requested memory for each gpu
<code>--gpus-per-task=2</code>	Requested number of gpus per task
<code>--ntasks-per-gpu=4</code>	Requested number of tasks per gpu (Not compatible with <code>--gpus-per-task</code> )
<code>--mail-user=user@swin.edu.au</code>	Sends emails on the progress of the job
<code>--wrap=""</code>	Run the specified string as a bash script using sbatch
<code>--tmp=8GB</code>	Specify a minimum amount of temporary disk space per node
<code>--array=0-10</code>	Run an array of jobs (multiple parallel jobs), 0-10 specifies the unique array-job-id

Many more Slurm options are available,  
see [slurm.schedmd.com/sbatch.html](https://slurm.schedmd.com/sbatch.html) for a comprehensive list.
